

Wednesday 20<sup>th</sup> May - Science

I have heard that lots of you are enjoying doing experiments, so I have sent you another one to do today.

A cactus is a plant that can live without much water. Even though it grows in a desert which is very hot and it doesn't rain often it still survives. We are going to do an experiment to test why.

Can you wet a piece of paper and put it in a tray outside, then can you fold a piece of paper, like a concertina and then wet that and put that outside on the tray.

In your blue book I want you to write

I predict ..... will dry out first.

The..... dried out first.

I was right/wrong because.....

Have fun!
